

1 01:00:47:07 01:00:48:20 CHAPIN:  
Measurement is the process

2 01:00:48:22 01:00:52:25 of quantifying properties  
of objects, and to do that,

3 01:00:52:27 01:00:56:21 we have set procedures  
that enable us to measure.

4 01:00:56:23 01:00:58:13 Oh.

5 01:00:58:15 01:01:00:27 Measuring helps you  
to understand

6 01:01:00:29 01:01:03:08 how things relate to each other.

7 01:01:03:10 01:01:09:07 CHAPIN:  
Our volume of a sphere actually  
has a formula of  $\frac{4}{3} \pi r^3$ .

8 01:01:09:09 01:01:12:21 This course really made me think  
about how I approach measurement

9 01:01:12:23 01:01:15:21 and how I can use measurement  
every day in the classroom.

10 01:01:21:01 01:01:24:17 NARRATOR:  
In today's session,

11 01:01:24:19 01:01:27:09 the class is going to examine  
the circumference  
and area of a circle.

12 01:01:27:11 01:01:29:27 They will investigate formulas  
for these measures,

13 01:01:29:29 01:01:32:09 and make sense  
of the unique relationship

14 01:01:32:11 01:01:35:02 between circles and  
the irrational number pi.

15 01:01:35:04 01:01:37:02 So we're going to kind  
of start our day today

16 01:01:37:04 01:01:39:04 by doing a little estimating

17 01:01:39:06 01:01:42:08 to just get ourselves  
thinking in circles.

18 01:01:42:10 01:01:45:23 Now, as you notice, some  
of you are bike riders,

19 01:01:45:25 01:01:49:28 and I have a bicycle wheel here,  
and we're going to look

20 01:01:50:00 01:01:55:02 at what we estimate to be  
the circumference of this wheel.

21 01:01:55:04 01:01:58:11 I've put a mark  
on the floor here,

22 01:01:58:13 01:02:04:03 and I've marked the edge,  
or the one point on the circle,

23 01:02:04:05 01:02:06:27 and then we're going  
to roll it along.

24 01:02:06:29 01:02:09:05 CHAPIN:  
Most adults do not estimate

25 01:02:09:07 01:02:13:16 the length of a circumference  
of a circular object very often.

26 01:02:13:18 01:02:16:17 We started the session by asking  
participants to estimate

27 01:02:16:19 01:02:20:18 the length of the circumference  
of a bicycle wheel.

28 01:02:20:20 01:02:23:13 Where do you think,  
along that line...

29 01:02:25:14 01:02:27:24 one rotation would take you?

30	01:02:27:26	01:02:28:24	All right.
31	01:02:28:26	01:02:29:24	Right here.
32	01:02:29:26	01:02:30:28	Right there, okay.
33	01:02:31:00	01:02:33:01	Now I need another volunteer.
34	01:02:33:03	01:02:34:10	Katy, come on up.
35	01:02:34:12	01:02:36:05	I think he's a little short.
36	01:02:36:07	01:02:37:05	Okay.
37	01:02:38:10	01:02:40:19	So this is where it's going to start.
38	01:02:47:12	01:02:48:10	Right there.
39	01:02:48:12	01:02:49:18	All right.
40	01:02:49:20	01:02:51:11	CHAPIN: We laid the wheel on the ground,
41	01:02:51:13	01:02:54:12	and after a couple of participants made estimates,
42	01:02:54:14	01:02:56:06	we then rolled it out.
43	01:02:56:08	01:02:59:06	Not surprisingly, one of the participants
44	01:02:59:08	01:03:02:05	had way underestimated the actual circumference,
45	01:03:02:07	01:03:04:00	and this is very typical.
46	01:03:04:02	01:03:07:25	We actually don't often use relationships in a circle
47	01:03:07:27	01:03:10:16	to help us estimate the circumference,
48	01:03:10:18	01:03:13:22	and, as a result, do underestimate its length.
49	01:03:13:24	01:03:17:05	But now I'd like to think about, how can we investigate
50	01:03:17:07	01:03:19:25	the relationship between the circumference
51	01:03:19:27	01:03:22:17	and the diameter of a circle?
52	01:03:22:19	01:03:26:14	And one way is that we can look at circles
53	01:03:26:16	01:03:29:22	that are inscribed in other shapes.
54	01:03:29:24	01:03:32:19	If you check out your packet on page two,
55	01:03:32:21	01:03:37:06	you will see a diagram of three different circles
56	01:03:37:08	01:03:40:05	that are inscribed in a square,
57	01:03:40:07	01:03:44:15	and then inscribed in the circle is a hexagon.
58	01:03:44:17	01:03:46:29	Now, we're going to take a couple of measures,
59	01:03:47:01	01:03:50:27	and we're going to put it up here on our poster
60	01:03:50:29	01:03:53:19	to look at the relationships here
61	01:03:53:21	01:04:00:17	between circles, squares and hexagons, okay?
62	01:04:00:19	01:04:03:26	So, let's take a look, and let's work together

63 01:04:03:28 01:04:06:08 to put this information up here.

64 01:04:06:10 01:04:09:13 In design one, what's  
the diameter of the circle

65 01:04:09:15 01:04:11:20 in that design?

66 01:04:11:22 01:04:12:29 Two.

67 01:04:13:01 01:04:14:11 Two centimeters.

68 01:04:13:01 01:04:14:11 Centimeters.

69 01:04:14:13 01:04:15:23 CHAPIN:  
All right.

70 01:04:15:25 01:04:19:21 What's the perimeter of  
the hexagon in that shape?

71 01:04:19:23 01:04:21:15 Six centimeters.

72 01:04:23:11 01:04:24:17 Okay.

73 01:04:24:19 01:04:26:29 CHAPIN:  
We were looking at a circle

74 01:04:27:01 01:04:29:13 that was bounded  
by a square and a hexagon,

75 01:04:29:15 01:04:31:10 each with the same diameter.

76 01:04:31:12 01:04:34:19 Now, we could use that  
information to help us look

77 01:04:34:21 01:04:38:02 for relationships between  
the perimeter of the square,

78 01:04:38:04 01:04:42:08 the perimeter of the hexagon and  
the circumference of the circle.

79 01:04:42:10 01:04:45:17 And what we found was that  
the circumference of the circle

80 01:04:45:19 01:04:47:27 was bounded by these  
other two perimeters.

81 01:04:47:29 01:04:52:00 The perimeter of the square  
was four times its diameter,

82 01:04:52:02 01:04:55:25 and the circumference, or  
perimeter, of the hexagon,

83 01:04:55:27 01:04:58:00 was three times the diameter,

84 01:04:58:02 01:05:02:09 and thus, in between was  
the circumference of the circle.

85 01:05:02:11 01:05:04:18 Now, we're going to go on  
and look at another way

86 01:05:04:20 01:05:06:03 that we perhaps can get closer.

87 01:05:06:05 01:05:08:12 We now know that  
the circumference

88 01:05:08:14 01:05:10:08 is between three and four,

89 01:05:10:10 01:05:13:20 but we haven't narrowed it down  
really precisely.

90 01:05:13:22 01:05:15:27 So let's look at the next page,

91 01:05:15:29 01:05:21:19 where you have some diagrams  
of regular polygons.

92 01:05:21:21 01:05:27:16 You have a square, a pentagon,  
a regular hexagon, octagon.

93 01:05:27:18 01:05:32:15 Now, what we're going to do is  
we are going to look again here

94 01:05:32:17 01:05:36:28 at the relationship between  
the perimeter of the shape

95 01:05:37:00 01:05:40:25 and a diagonal, or a diameter,  
of a shape.

96 01:05:40:27 01:05:43:07 CHAPIN:  
Now that we'd narrowed down

97 01:05:43:09 01:05:46:08 that circumference-diameter  
relationship

98 01:05:46:10 01:05:49:28 was between three and four times  
that diameter,

99 01:05:50:00 01:05:54:06 we went and looked at regular  
polygons, and we started

100 01:05:54:08 01:05:57:17 with polygons with a very  
small number of sides

101 01:05:57:19 01:06:00:03 and went up  
to many-sided polygons,

102 01:06:00:05 01:06:01:26 in this case a dodecagon.

103 01:06:01:28 01:06:05:17 In each one, we measured the  
perimeter and formed a ratio

104 01:06:05:19 01:06:08:06 comparing it to both  
the diagonal length

105 01:06:08:08 01:06:10:09 and the diameter length.

106 01:06:10:11 01:06:13:24 Okay, so I'm  
going to do six  
divided by ten?

107 01:06:13:26 01:06:15:02 You get  
six-tenths.

108 01:06:15:04 01:06:16:26 Yeah, this is  
a little bit bigger.

109 01:06:16:28 01:06:18:02 It is.

110 01:06:18:04 01:06:19:09 If you look at the...

111 01:06:19:11 01:06:21:23 looking at the picture,  
going straight across,

112 01:06:21:25 01:06:24:15 instead of not quite  
going straight across...

113 01:06:24:17 01:06:25:15 Okay.

114 01:06:25:17 01:06:26:27 It doesn't look...

115 01:06:26:29 01:06:28:14 All right,  
I can see that.

116 01:06:28:16 01:06:31:04 I wonder if  
that's the case  
in all of them.

117 01:06:31:06 01:06:32:23 Probably,  
probably, yeah.

118 01:06:32:25 01:06:36:10 CHAPIN:  
What people found as they  
converted their ratios

119 01:06:36:12 01:06:40:09 was that their numbers were  
coming very close to pi,

120 01:06:40:11 01:06:44:12 and as the shape had more  
and more sides, we realized

121 01:06:44:14 01:06:48:04 that it was becoming even  
a closer approximation to pi,

122 01:06:48:06 01:06:50:17 and one way we can  
think about it is

123 01:06:50:19 01:06:55:01 that as we make the side lengths  
shorter and shorter and shorter,

124 01:06:55:03 01:06:57:26 the distance between each  
of the vertices

125 01:06:57:28 01:07:02:06 is becoming less and less, and  
the actual diameter or diagonal

126 01:07:02:08 01:07:06:04 are becoming closer and closer

127 01:07:06:06 to a diameter of a circle,  
 01:07:08:23 because it's approximating  
 a circle.  
 128 01:07:08:25 01:07:11:16 And thus,  
 our perimeter-diameter ratio  
 129 01:07:11:18 01:07:14:24 is going to come closer  
 and closer to pi.  
 130 01:07:14:26 01:07:18:13 So we notice that when we  
 have a perimeter of 3.5,  
 131 01:07:18:15 01:07:20:29 and we had measured  
 that diameter,  
 132 01:07:21:01 01:07:23:01 and we reduce that ratio,  
 133 01:07:23:03 01:07:26:27 we get three point...  
 approximately 3.29 to one.  
 134 01:07:26:29 01:07:28:01 Okay.  
 135 01:07:28:03 01:07:30:15 It's a little bit  
 more than pi.  
 136 01:07:30:17 01:07:32:06 And I had found four  
 before we had done it,  
 137 01:07:32:08 01:07:33:06 except measured  
 exactly.  
 138 01:07:33:08 01:07:34:19 Uh-huh.  
 139 01:07:34:21 01:07:37:12 Now, how about you when you  
 did the... the diagonal?  
 140 01:07:37:14 01:07:39:06 What kind of a ratio  
 did you get?  
 141 01:07:39:08 01:07:40:09 I came up with 2.9.  
 142 01:07:40:11 01:07:41:13 Oh, interesting.  
 143 01:07:41:15 01:07:43:12 So one ratio is  
 a little less than pi,  
 144 01:07:43:14 01:07:45:19 and another ratio is  
 a little more than pi.  
 145 01:07:45:21 01:07:47:15 What do you think  
 is going to happen  
 146 01:07:47:17 01:07:49:15 as we get, um, to a larger...  
 147 01:07:49:17 01:07:51:23 a shape with more  
 and more sides?  
 148 01:07:51:25 01:07:54:07 They'll probably  
 become a closer...  
 149 01:07:54:09 01:07:55:19 closer to each other.  
 150 01:07:55:21 01:07:56:25 Yeah, I think.  
 151 01:07:56:27 01:07:58:11 So let's go and  
 investigate that.  
 152 01:07:58:13 01:08:00:25 That sounds like a great  
 idea of what to do next.  
 153 01:08:02:29 01:08:06:08 Okay, let's talk  
 about some of the results  
 154 01:08:06:10 01:08:08:09 that we have just gotten.  
 155 01:08:08:11 01:08:11:12 What do people notice  
 about the ratios  
 156 01:08:11:14 01:08:15:07 that they were forming  
 of some of these figures?  
 157 01:08:15:09 01:08:17:18 Remember, that's a ratio  
 of the perimeter  
 158 01:08:17:20 01:08:21:23 to either the diameter  
 or the diagonal.

159 01:08:21:25 01:08:24:17 As the polygons that we were  
measuring had more sides--  
160 01:08:24:19 01:08:27:13 as we went from a pentagon  
to a hexagon to an octagon--  
161 01:08:27:15 01:08:31:14 the ratios got closer  
to the number of pi.  
162 01:08:31:16 01:08:36:04 How is this helping us make  
sense of the relationship  
163 01:08:36:06 01:08:41:15 in a circle,  
between perimeter and diameter?  
164 01:08:41:17 01:08:46:03 We were looking at, also,  
the narrowing of the difference  
165 01:08:46:05 01:08:49:10 between the perimeter  
and diameter ratio,  
166 01:08:49:12 01:08:52:09 and the perimeter  
and diagonal ratio,  
167 01:08:52:11 01:08:55:22 and we were saying  
that it would make sense  
168 01:08:55:24 01:08:56:29 that that should narrow,  
169 01:08:57:01 01:08:58:21 because when you  
get to a circle,  
170 01:08:58:23 01:09:01:28 there's no difference  
between those two measures,  
171 01:09:02:00 01:09:05:13 because there isn't a vertex  
versus a middle of a side.  
172 01:09:05:15 01:09:08:18 And as you increase  
the number of sides  
on these polygons,  
173 01:09:08:20 01:09:10:02 you're approaching  
a circle,  
174 01:09:10:04 01:09:12:13 in which case those two  
would be diameters,  
175 01:09:12:15 01:09:14:15 so they should  
be the same.  
176 01:09:14:17 01:09:16:07 CHAPIN:  
Exactly.  
177 01:09:16:09 01:09:19:00 Well, let's now actually  
investigate  
178 01:09:19:02 01:09:22:04 the relationship in circles,  
all right?  
179 01:09:22:06 01:09:23:17 So our next activity is  
180 01:09:23:19 01:09:25:23 that we're going to do  
a little bit of measuring,  
181 01:09:25:25 01:09:29:02 and then we are going to collect  
data and put it together.  
182 01:09:29:04 01:09:32:14 CHAPIN:  
We then wanted to actually  
look at the relationship  
183 01:09:32:16 01:09:35:29 in circular objects, so we  
measured many different objects  
184 01:09:36:01 01:09:38:22 and formed ratios of  
circumference to diameter,  
185 01:09:38:24 01:09:41:26 reduced those, and we found  
that most of these ratios  
186 01:09:41:28 01:09:45:15 were very close to an  
approximate value of pi--

187 01:09:45:17 01:09:47:01 3.14, approximately, to one.  
188 01:09:47:03 01:09:49:07 It also led us  
to be able to talk about,  
189 01:09:49:09 01:09:52:05 "Well, what do you do when you  
collect a lot of data  
190 01:09:52:07 01:09:54:07 and it's all not  
exactly the same?"  
191 01:09:54:09 01:09:57:18 We could find averages,  
we could look at extremes,  
192 01:09:57:20 01:09:59:16 and then find a median value.  
193 01:09:59:18 01:10:02:08 But we can also then use that  
to just show  
194 01:10:02:10 01:10:05:09 that we are going to have some  
inaccuracy in our measurement  
195 01:10:05:11 01:10:07:04 when we do it  
in a physical manner.  
196 01:10:07:06 01:10:08:22 Just about 38.  
197 01:10:08:24 01:10:11:12 38.7.  
198 01:10:11:14 01:10:12:17 Okay.  
199 01:10:12:19 01:10:15:08 And it was almost  
38 before, so...  
200 01:10:15:10 01:10:17:16 We're real close.  
201 01:10:17:18 01:10:19:09 So if we take...  
202 01:10:19:11 01:10:21:09 Um, actually 37.7,  
203 01:10:21:11 01:10:24:09 because it  
wasn't quite 38,  
204 01:10:24:11 01:10:29:07 so if we take 37.7,  
divided by our diameter,  
205 01:10:29:09 01:10:32:08 which was 12...  
206 01:10:32:10 01:10:34:09 we get three point...  
207 01:10:34:11 01:10:35:09 one, four.  
208 01:10:35:11 01:10:36:09 3.14.  
209 01:10:36:11 01:10:37:29 That makes sense.  
210 01:10:38:01 01:10:41:05 CHAPIN:  
One of the very interesting  
things about circles  
211 01:10:41:07 01:10:44:19 is that the relationship between  
circumference and diameter,  
212 01:10:44:21 01:10:47:28 no matter what size the circle,  
is always going to be pi.  
213 01:10:48:00 01:10:49:16 It's an irrational number.  
214 01:10:49:18 01:10:52:24 So circumference divided  
by diameter equals pi.  
215 01:10:52:26 01:10:55:14 And this has fascinated  
mathematicians  
216 01:10:55:16 01:10:59:08 for thousands of years,  
because it is a constant ratio.  
217 01:10:59:10 01:11:01:09 In fact, that's one reason  
218 01:11:01:11 01:11:05:03 the number pi actually has a  
special name-- because of its...  
219 01:11:05:05 01:11:08:02 the constant nature in terms  
of the relationship  
220 01:11:08:04 01:11:10:08 between circumference  
and diameter.  
221 01:11:14:14 01:11:17:05 Well, our next activity  
is going to involve

222 01:11:17:07 01:11:20:03 us trying to make sense  
of this area formula.

223 01:11:20:05 01:11:21:29 Where did it come from?

224 01:11:22:01 01:11:25:19 Why is this the formula  
for area of a circle?

225 01:11:25:21 01:11:28:21 And what you're going  
to work with is,

226 01:11:28:23 01:11:32:02 you each have circular disks  
on your table

227 01:11:32:04 01:11:35:10 that you are going to cut  
into sections

228 01:11:35:12 01:11:41:16 and re-create your sectors  
into a parallelogram.

229 01:11:41:18 01:11:46:00 So we're going to see if we  
can use another area formula

230 01:11:46:02 01:11:50:06 to help us make sense  
of the formula for a circle.

231 01:11:50:08 01:11:52:00 So we should end up  
with eight pieces?

232 01:11:52:02 01:11:53:23 And we're going  
to put them together

233 01:11:53:25 01:11:54:26 to make  
a parallelogram?

234 01:11:54:28 01:11:55:27 Right.

235 01:12:02:20 01:12:06:21 Okay, so, we're going  
to do... this way.

236 01:12:06:23 01:12:07:28 ( *class talking* )

237 01:12:08:00 01:12:11:02 So that they're  
lined up like that, yeah.

238 01:12:11:04 01:12:12:24 Okay.

239 01:12:12:26 01:12:14:17 CHAPIN:  
In area of a circle,

240 01:12:14:19 01:12:18:08 we were really trying to make  
sense of the area formulas--

241 01:12:18:10 01:12:20:11 to justify them, to explain them

242 01:12:20:13 01:12:23:27 in terms that would make sense  
to the ordinary lay person.

243 01:12:23:29 01:12:28:02 We took a circle and divided it  
up into very, very small wedges.

244 01:12:28:04 01:12:29:25 We then cut the wedges out

245 01:12:29:27 01:12:32:05 and rearranged them  
to form something

246 01:12:32:07 01:12:35:06 that looked approximately  
like a parallelogram.

247 01:12:35:08 01:12:37:08 We then could  
actually figure out

248 01:12:37:10 01:12:40:24 what was the base and the height  
of that parallelogram

249 01:12:40:26 01:12:42:11 and determine the area.

250 01:12:42:13 01:12:46:24 And we linked what we found  
to the area-of-a-circle formula.

251 01:12:46:26 01:12:48:13 Is that on  
that point?

252 01:12:48:15 01:12:49:14 Yeah.

253 01:12:51:17 01:12:56:13 It's 29.3.

254 01:12:56:15 01:12:57:21 Okay?

255 01:12:57:23 01:13:00:15 So how does the area  
of the figure compare

256 01:13:00:17 01:13:02:12 with the area of the circle?

257 01:13:05:05 01:13:07:06 Well, we can use  
the formula to start,

258 01:13:07:08 01:13:09:24 to figure out what  
the area of the circle was

259 01:13:09:26 01:13:10:24 and then...

260 01:13:10:26 01:13:11:24 Should we try that?

261 01:13:11:26 01:13:12:24 Yeah, let's do that.

262 01:13:12:26 01:13:13:29 Okay.

263 01:13:14:01 01:13:16:24 So pi... or ra...

264 01:13:16:26 01:13:19:20 Area equals pi radius-squared.

265 01:13:19:22 01:13:21:03 Right.

266 01:13:21:05 01:13:23:23 Okay, and the radius was 9.5.

267 01:13:25:00 01:13:30:22 "9.5 times 9.5  
equals 90.25"

268 01:13:30:24 01:13:34:01 is our radius-squared  
times pi.

269 01:13:34:03 01:13:40:18 ( *class discussing* )

270 01:13:40:20 01:13:44:16 283.53...

271 01:13:44:18 01:13:45:23 Point five three,  
yeah.

272 01:13:45:25 01:13:47:22 We can take it to  
the hundredths place.

273 01:13:47:24 01:13:50:12 All right, so that's the area  
according to the formula--

274 01:13:50:14 01:13:51:14 the circle.

275 01:13:51:16 01:13:53:07 Okay.

276 01:13:54:16 01:14:00:21 Then, to find the area  
of the parallelogram...

277 01:14:00:23 01:14:02:18 I think it's  
base times height.

278 01:14:02:20 01:14:10:20 Okay, so 9.5 times 29...  
times 29.3.

279 01:14:10:22 01:14:12:06 Okay.

280 01:14:12:08 01:14:17:12 Area... I got 278.35.

281 01:14:17:14 01:14:18:23 Yeah.

282 01:14:18:25 01:14:22:02 When we did the area of  
the circle with the formula,

283 01:14:22:04 01:14:25:15 we came up with about  
five centimeters more.

284 01:14:27:22 01:14:30:02 So how does the area  
of the figure compare

285 01:14:30:04 01:14:31:18 with the area  
of the circle?

286 01:14:32:27 01:14:36:00 It's point... or, it's  
five centimeters less?

287 01:14:36:02 01:14:37:04 Less-- right.

288 01:14:37:06 01:14:38:05 Okay.

289 01:14:38:07 01:14:39:24 Can everybody look up here?

290 01:14:39:26 01:14:43:05 What I'd like us now to do  
is talk a little bit

291 01:14:43:07 01:14:48:06 about how we can make sense of  
this area of a circle formula,

292 01:14:48:08 01:14:49:22 pi r-squared.

293 01:14:49:24 01:14:51:08 Susan, do you mind coming up  
 294 01:14:51:10 01:14:54:00 and showing everyone what you  
 and I were talking about?  
 295 01:14:54:02 01:14:56:21 NARRATOR:  
 On this chart is a drawing  
 of circle wedges  
 296 01:14:56:23 01:15:00:22 arranged to form what looks  
 approximately like a rectangle.  
 297 01:15:00:24 01:15:01:29 With this in mind,  
 298 01:15:02:01 01:15:04:06 the participant gives  
 her explanation.  
 299 01:15:04:08 01:15:05:24 Okay, if we know  
 300 01:15:05:26 01:15:12:03 that the formula for the area  
 of a circle equals  $\pi r^2$   
 301 01:15:12:05 01:15:14:25 and we examine  
 our figure here...  
 302 01:15:14:27 01:15:16:08 If we notice  
 303 01:15:16:10 01:15:19:23 that all of these little wedges  
 together form the base  
 304 01:15:19:25 01:15:22:02 and that there's two set  
 of wedges,  
 305 01:15:22:04 01:15:24:09 we can think of the base  
 306 01:15:24:11 01:15:29:11 as being equal to half  
 the circumference of the circle.  
 307 01:15:29:13 01:15:34:01 So the base equals  
 one-half the circumference.  
 308 01:15:34:03 01:15:35:05 Okay?  
 309 01:15:35:07 01:15:37:29 Or we can also think of that  
 310 01:15:38:01 01:15:42:03 as being the circumference  
 divided by two.  
 311 01:15:42:05 01:15:46:06 Circumference is equal  
 to  $2\pi r$ , or  $\pi D$ .  
 312 01:15:46:08 01:15:49:21 So I'm going to say,  
 313 01:15:49:23 01:15:55:01 if I think of the circumference  
 equaling  $\pi D$ ,  
 314 01:15:55:03 01:15:59:19 or  $2\pi r$ ...  
 315 01:15:59:21 01:16:03:15 now I have another way  
 of thinking of the base.  
 316 01:16:03:17 01:16:05:10 So I'm going to say  
 317 01:16:05:12 01:16:11:11 that the base equals...  
 318 01:16:11:13 01:16:15:19  $2\pi r$  divided by two,  
 319 01:16:15:21 01:16:18:12 because I had thought  
 of my circumference  
 320 01:16:18:14 01:16:20:02 as being divided by two.  
 321 01:16:20:04 01:16:25:07 And if I think about  
 canceling out these two 2s,  
 322 01:16:25:09 01:16:29:19 I can say that the base is equal  
 to  $\pi r$ .  
 323 01:16:29:21 01:16:33:12 So I have my dimension for this.  
 324 01:16:33:14 01:16:35:04 Now I need to come back  
 325 01:16:35:06 01:16:39:21 and I need to think about this  
 measurement to find the area.  
 326 01:16:39:23 01:16:43:08 And if I look at these wedges,  
 I know that it's actually...  
 327 01:16:43:10 01:16:46:26 this measurement is actually  
 just the radius of my circle.

328 01:16:46:28 01:16:51:18 And if we think of area as  
equaling length times width,

329 01:16:51:20 01:16:56:06 I can multiply my radius  
times my pi r.

330 01:16:56:08 01:17:02:19 Consequently, I go back  
to my formula of pi r-squared.

331 01:17:02:21 01:17:05:15 NARRATOR:  
When wedges of a circle are  
rearranged

332 01:17:05:17 01:17:08:10 to approximate a parallelogram  
like this one,

333 01:17:08:12 01:17:10:24 it helps make sense  
of the formula

334 01:17:10:26 01:17:12:21 for the area of a circle.

335 01:17:12:23 01:17:14:28 Now we're also going  
to continue to think

336 01:17:15:00 01:17:18:01 about the formula for area  
of a circle in one other way.

337 01:17:18:03 01:17:22:18 And that is, sometimes  
when you say "r-squared"

338 01:17:22:20 01:17:24:02 we think of the radius,

339 01:17:24:04 01:17:31:22 but we could also think  
of a square

340 01:17:31:24 01:17:35:11 in which each side is length r,

341 01:17:35:13 01:17:42:26 and thus the area of that little  
square there is r-squared.

342 01:17:42:28 01:17:45:15 Now, you have some sheets

343 01:17:45:17 01:17:47:28 that have some different circles  
on them

344 01:17:48:00 01:17:52:25 and on each one  
there is a blackened square

345 01:17:52:27 01:17:57:27 which represents r-squared  
for that circle--

346 01:17:57:29 01:18:02:06 namely, it is a square  
with sides of length r,

347 01:18:02:08 01:18:05:15 and its area is r-squared.

348 01:18:05:17 01:18:07:26 And what we want to do is

349 01:18:07:28 01:18:13:26 see how many of these r-squared  
squares will fit in one circle.

350 01:18:13:28 01:18:14:26 Like this...

351 01:18:14:28 01:18:16:09 We can just figure out  
this piece

352 01:18:16:11 01:18:17:25 and figure out  
how much of it it is

353 01:18:17:27 01:18:19:09 and we can multiply it  
by four.

354 01:18:19:11 01:18:21:18 Right. I'm thinking  
that this complements  
this somehow;

355 01:18:21:20 01:18:25:07 that once we know this,

356 01:18:25:09 01:18:26:12 we would know  
the reverse.

357 01:18:26:14 01:18:27:20 Mm-hmm.

358 01:18:27:22 01:18:28:29 Does that make...

359 01:18:29:01 01:18:31:13 And then we could figure out  
what we've taken away?

360 01:18:31:15 01:18:34:03 Maybe.  
 361 01:18:34:05 01:18:35:20 Because it's  
 symmetric, too.  
 362 01:18:35:22 01:18:38:18 Like, if we  
 could figure out  
 how much this piece is,  
 363 01:18:38:20 01:18:40:23 then that piece  
 and that piece are  
 kind of obvious  
 364 01:18:40:25 01:18:42:04 because they're  
 whole squares.  
 365 01:18:42:06 01:18:43:15 Squares, right.  
 366 01:18:43:17 01:18:45:26 And then this one  
 and this one are  
 exactly the same.  
 367 01:18:45:28 01:18:47:06 And if you look...  
 well, yeah.  
 368 01:18:49:05 01:18:53:07 What I'm wondering is  
 if two of these  
 complete this.  
 369 01:18:55:11 01:18:56:14 Well, we can...  
 370 01:18:56:16 01:18:58:08 Maybe that's what we  
 can cut out and try.  
 371 01:18:58:10 01:18:59:16 Try.  
 372 01:18:59:18 01:19:01:08 CHAPIN:  
 In the next activity,  
 373 01:19:01:10 01:19:04:13 what if we take squares  
 that are r-squared size,  
 374 01:19:04:15 01:19:05:14 and cover a circle?  
 375 01:19:05:16 01:19:07:04 How many of them will it take?  
 376 01:19:07:06 01:19:10:25 Participants took squares,  
 they cut them out,  
 377 01:19:10:27 01:19:14:01 they tried to fit them  
 onto the circles  
 378 01:19:14:03 01:19:17:28 and they found that three  
 and a little bit more  
 379 01:19:18:00 01:19:21:19 of those r-squared squares fit  
 on the circle.  
 380 01:19:21:21 01:19:24:13 Now, if we relate that  
 to the formula,  
 381 01:19:24:15 01:19:28:16 we know the formula for area is  
 area equals pi r-squared,  
 382 01:19:28:18 01:19:32:07 so the pi is approximately  
 a little more than three--  
 383 01:19:32:09 01:19:35:13 3.1 or so-- and we found  
 that that was exactly  
 384 01:19:35:15 01:19:39:04 how many of those r-squares  
 squared we needed  
 385 01:19:39:06 01:19:40:19 to cover the surface.  
 386 01:19:40:21 01:19:42:04 CHAPIN:  
 Did anybody have any luck  
 387 01:19:42:06 01:19:46:01 doing that, or, uh,  
 skilled precision  
 388 01:19:46:03 01:19:51:19 in terms of about how many  
 of these r-square squares  
 389 01:19:51:21 01:19:58:12 were they able to fit on, um...

cover the area of their circle?

390 01:19:58:14 01:20:00:12 I used the negative space  
391 01:20:00:14 01:20:03:11 to find out how much less  
than four squares I used.

392 01:20:03:13 01:20:04:14 Ah, so you...  
393 01:20:04:16 01:20:05:25 Okay.  
394 01:20:05:27 01:20:07:29 So I cut off  
the little bits...

395 01:20:08:01 01:20:09:27 Little curves around, yeah.  
396 01:20:09:29 01:20:12:22 And found out how many square  
units were in those little bits  
397 01:20:12:24 01:20:13:25 and then subtracted it.  
398 01:20:13:27 01:20:16:02 Ah, and so then  
you also got...

399 01:20:16:04 01:20:19:04 I got that it was  
three and one-ninth.  
400 01:20:19:06 01:20:21:02 Okay, so three  
and a little bit more.  
401 01:20:21:04 01:20:24:26 Does this three and one-ninth,  
three and a little bit more,  
402 01:20:24:28 01:20:28:18 remind us of any number that  
we've been talking about today?  
403 01:20:28:20 01:20:29:26 ( *laughter* )  
404 01:20:29:28 01:20:33:19 Pi. And so again,  
what's happening here is  
405 01:20:33:21 01:20:37:06 it's about pi number  
of these r-squares  
406 01:20:37:08 01:20:40:09 that we are able to place  
in here--  
407 01:20:40:11 01:20:42:26 pi being a little more  
than three--  
408 01:20:42:28 01:20:47:17 and thus that's one reason  
why in our approximate attempts,  
409 01:20:47:19 01:20:49:26 that's about what we're coming  
up with.  
410 01:20:49:28 01:20:53:03 In our session today,  
we've investigated circles;  
411 01:20:53:05 01:20:56:09 in particular we've tried  
to make sense of the formulas  
412 01:20:56:11 01:20:58:15 for circumference  
and area of circles.  
413 01:20:58:17 01:21:02:05 We use these geometric shapes  
all the time  
414 01:21:02:07 01:21:04:21 and it's important for us  
to have actually...  
415 01:21:04:23 01:21:05:29 to be able to justify:  
416 01:21:06:01 01:21:07:27 Where do these formulas  
come from?  
417 01:21:07:29 01:21:09:18 How do we make sense of them?  
418 01:21:09:20 01:21:11:16 Which is what we've focused on  
today.  
419 01:21:24:29 01:21:28:17 WOMAN:  
The circle is a very important  
shape in Islam.  
420 01:21:28:19 01:21:30:28 It represents, visually,  
a metaphor

421 01:21:31:00 01:21:33:19 for the religious philosophy  
of Islam,

422 01:21:33:21 01:21:37:04 as well as, physically,  
it informs the art

423 01:21:37:06 01:21:39:17 and architecture of Islam.

424 01:21:39:19 01:21:44:16 The circle starts with a center  
point that determines its shape.

425 01:21:44:18 01:21:48:19 This center point can also be  
seen as God, or Allah.

426 01:21:48:21 01:21:52:22 God radiates his message  
through the Koran,

427 01:21:52:24 01:21:54:27 as you can see here  
in the radius.

428 01:21:54:29 01:21:59:00 The Koran is then given  
to Prophet Muhammad

429 01:21:59:02 01:22:05:16 to disseminate, or to spread,  
the knowledge of God's word.

430 01:22:05:18 01:22:09:04 By doing so, Prophet Muhammad  
creates a community,

431 01:22:09:06 01:22:12:15 or a circumference,  
of the circle, or a circle.

432 01:22:12:17 01:22:16:17 And that circumference  
represents the Ummah in Islam.

433 01:22:16:19 01:22:20:14 The center is further empowered  
by the five daily prayers

434 01:22:20:16 01:22:26:22 that Muslims must perform facing  
Mecca, or the Kaba in Mecca.

435 01:22:26:24 01:22:31:14 The circle also represents,  
visually, the dome of heaven.

436 01:22:31:16 01:22:36:19 Here in this plan of a mosque,  
we can see the dome of heaven

437 01:22:36:21 01:22:40:07 as represented by a full  
and complete circle.

438 01:22:40:09 01:22:44:05 All points on the circumference  
of a circle are equidistant

439 01:22:44:07 01:22:45:13 from the center.

440 01:22:45:15 01:22:48:17 To determine how large  
the dome will be,

441 01:22:48:19 01:22:53:03 the architect must first figure  
out the area of the circle.

442 01:22:53:05 01:22:56:28 And the area is derived  
by "area equals pi r-squared,"

443 01:22:57:00 01:22:59:03 and that determines for him

444 01:22:59:05 01:23:03:11 the space that he needs to allow  
for the dome to fit.

445 01:23:03:13 01:23:08:17 In this plan we see a series  
of circles and semicircles.

446 01:23:08:19 01:23:11:19 The semicircles are used  
structurally

447 01:23:11:21 01:23:13:23 to support the main dome.

448 01:23:13:25 01:23:17:26 The circle again becomes  
the point of departure,

449 01:23:17:28 01:23:22:05 or the beginning, of  
a decorative pattern in Islam.

450 01:23:22:07 01:23:25:04 This is a 12-pointed star.

451 01:23:25:06 01:23:28:15 The circle is divided equally

452 01:23:28:17 01:23:32:21 using the diagonals,  
 or the diameters, of the circle,  
 453 01:23:32:23 01:23:36:19 which then measure the points,  
 or place the points  
 454 01:23:36:21 01:23:39:08 where the squares are  
 superimposed  
 455 01:23:39:10 01:23:41:25 to reveal stars, or star shapes.  
 456 01:23:41:27 01:23:46:06 The artisan then blacks out  
 some points of the star  
 457 01:23:46:08 01:23:48:29 and leaves others open,  
 or white,  
 458 01:23:49:01 01:23:52:04 to create a wonderfully rich  
 pattern.  
 459 01:23:52:06 01:23:54:19 The students in my class  
 also practice  
 460 01:23:54:21 01:23:58:08 this age-old Islamic tradition  
 of pattern-making  
 461 01:23:58:10 01:24:00:24 by first starting  
 with the circle  
 462 01:24:00:26 01:24:03:11 in which they superimpose  
 squares  
 463 01:24:03:13 01:24:07:06 by dividing the diameters  
 of the circle.  
 464 01:24:07:08 01:24:09:18 This then generated  
 a star pattern  
 465 01:24:09:20 01:24:12:23 which then evolved into a more  
 organic shape  
 466 01:24:12:25 01:24:14:18 of leaves and petals.  
 467 01:24:14:20 01:24:17:03 Once the motif was perfected,  
 468 01:24:17:05 01:24:21:08 it was then used to fabricate  
 this Islamic panel.  
 469 01:24:21:10 01:24:26:04 The corners of the panels remain  
 constant to the original design,  
 470 01:24:26:06 01:24:30:12 but the connectors, or the vines  
 that connect the corners,  
 471 01:24:30:14 01:24:33:08 are derivatives  
 of the original motif.  
 472 01:24:38:29 01:24:41:24 The classical arch is  
 the Roman arch,  
 473 01:24:41:26 01:24:46:05 and that's constructed  
 through the use of semicircles.  
 474 01:24:46:07 01:24:49:08 But the Islamic arch is pointed  
 at the apex  
 475 01:24:49:10 01:24:52:11 and doesn't have a complete  
 and rounded top  
 476 01:24:52:13 01:24:53:26 like the Roman arch.  
 477 01:24:53:28 01:24:57:04 To arrive at the Islamic arch,  
 478 01:24:57:06 01:25:01:11 we intersected  
 two perfect semicircles;  
 479 01:25:01:13 01:25:03:27 their point of intersection  
 became  
 480 01:25:03:29 01:25:06:24 the center point  
 of the Islamic arch.  
 481 01:25:09:19 01:25:14:07 This allowed for a perfect  
 Islamic pointed arch  
 482 01:25:14:09 01:25:17:11 to be perceived in the design.

483 01:25:18:28 01:25:21:28 All the points of these arches  
essentially go back  
484 01:25:22:00 01:25:24:01 to the source, the center.  
485 01:25:24:03 01:25:27:19 The success of this project  
allowed this panel to be chosen  
486 01:25:27:21 01:25:29:01 for the new mosque  
487 01:25:29:03 01:25:32:00 that will be completed in Boston  
in the near future.
